

SCALER

Screening Assignment

The Ask

Build an AI persona of yourself that we can call, chat with, and use to book an interview. If it works, we'll know you can do the job.

Part A: Voice Agent

Provide a phone number we can call. When we do, your AI persona should:

- Introduce itself as your AI representative
- Answer questions about your background, skills, and fit for this role
- Handle follow-ups and casual conversation naturally, not scripted Q&A
- Ask for our availability and propose slots from your real calendar
- Book a meeting without any human intervention, confirmed end-to-end

Stack hints: Vapi · Retell · ElevenLabs · Deepgram · Twilio

Part B: Chat Interface

Deploy a public chat URL. We should be able to:

- Ask why you are the right person for this role and get a specific, compelling answer
- Ask about any GitHub repo you have built and it should know the tech, the purpose, and the tradeoffs
- Ask about your resume: education, experience, projects; accurate and specific
- Ask about your availability and book a call directly from the chat
- Probe with edge cases and it should stay honest, not hallucinate

The persona must be RAG-grounded over your actual resume and GitHub. No hardcoded answers.

Part C: Evals Report

Submit a 1-page report covering:

- How you measured voice quality: latency, accuracy, task completion
- How you measured chat groundedness: hallucination rate, retrieval quality

- 3 failure modes you found and how you fixed them
- What you'd improve with 2 more weeks

Hard Requirements

Requirement	Detail
Live at submission	Voice and chat must be live when you send the email. No screenshots.
Real calendar booking	Actual availability, actual confirmation via Calendly / Cal.com / Google Calendar
RAG grounded	Chat persona reads your real resume and GitHub, not hardcoded strings
Voice latency	< 2s first response; handles interruptions without crashing
Public GitHub repo	Clean README, architecture diagram, setup instructions
Eval report	1 page PDF, submitted alongside the links
